LETTER OF AUTHORIZATION

This is to certify that the following company is authorized to act as

REPRESENTATION
IN THE FIELD OF CHAIN EQUIPMENT FOR
COAL POWER PLANTS IN MALAYSIA

of RUD Ketten Rieger & Dietz GmbH u. Co. KG, 73432 Aalen, Germany in Malaysia:

Mectrid Integrated Technology Sdn. Bhd.
Lot No. 70, Taman PKNK, Tikam Batu,
08600 Sungai Petani, Kedah
Malaysia

Registered as:
limited partnership
with headquarters in
Aalen-Unterkochen
at county court
Ulm HRA 500160

Fully liable partner:
RUD-Kettenfabrik Gebr. Rieger GmbH
with headquarters in Aalen-Unterkochen
registered at county court
Ulm HRB 500065

Board of directors
Dr. Hansjoerg Rieger
Joerg S. Rieger, Ph.D.
Johannes W. Rieger
Benjamin T. Rieger

Bank connections:
VR Bank Aalen Nr. 104 445 009 BLZ 614 901 50
Deutsche Bank AG Nr. 16 326 37 BLZ 613 700 86
KSK Ostalb Nr. 110 084 741 BLZ 614 500 50
Postbank, Stuttgart Nr. 42 03 706 BLZ 600 100 70

VAT Number: DE 144 651102

This authorization covers RUD chain systems for coal power plant applications, palm oil plants, biomass energy systems, waste-to-energy plants.

Your sincerely,

RUD Ketten
Rieger & Dietz GmbH u. Co. KG

RUD
RUD Ketten
Rieger & Dietz GmbH u. Co. KG
73428 Aalen/Germany

Johannes Mück

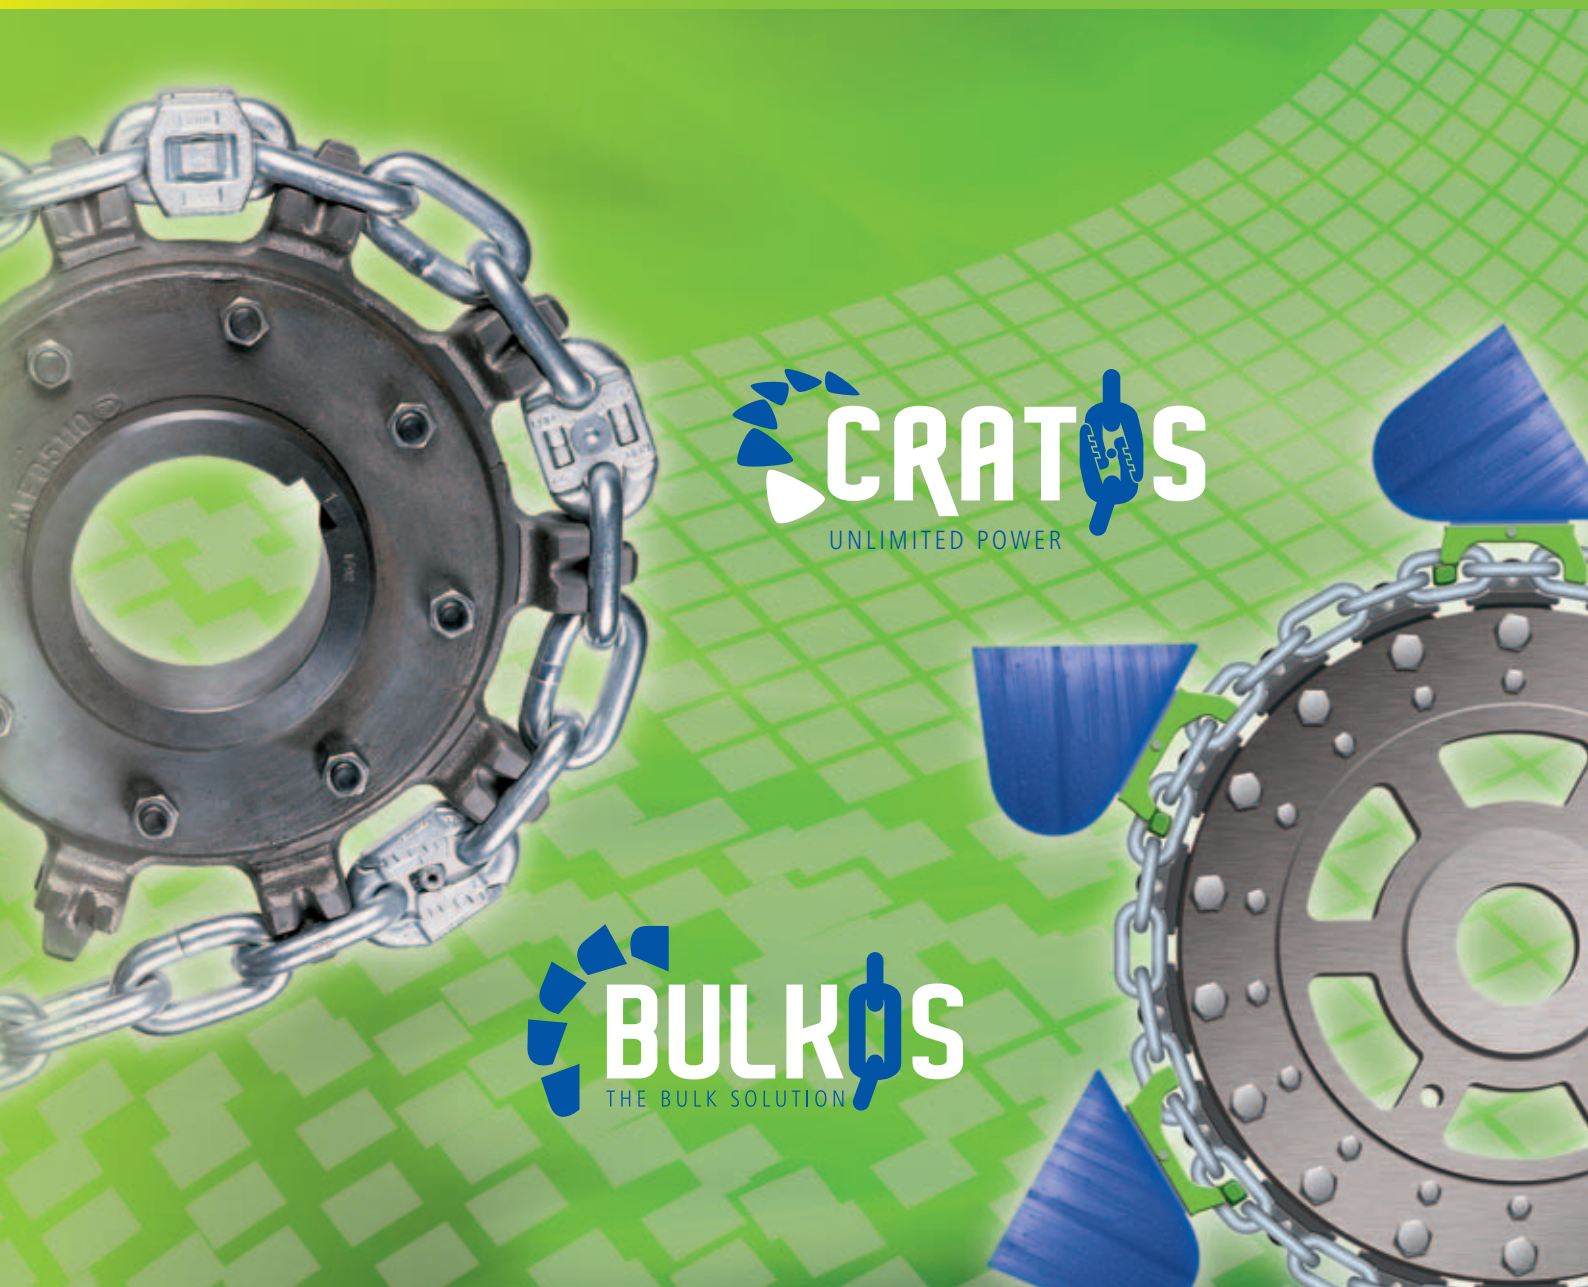
RUD®

RUD CONVEYOR SYSTEMS

ENG

EDITION_1

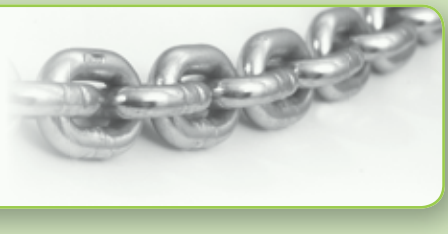
FOR HORIZONTAL, VERTICAL AND INCLINED CONVEYORS



Do you experience any of these conveyor issues

Is your chain equipment wearing out too quickly?

The new RUD chain grades offer optimal wear resistance.
> More on page 5



Are your chains or the teeth of the gears suddenly breaking? Is your system coming to a standstill due to this? How much is the damage if you have to shut down the system as a result of this?

The new chain grades offer up to 28 % improvement in breaking force. Your system will run safer and the risk of breaking will be minimised..
> More on page 6

Are you experiencing difficulties when installing components?

Then try our installation-friendly innovations such as DUOMOUNT® or **2win**.
> More on page 25 and 41

Are you missing an on-site contact person?

Then contact our nearest branch.
> More at www.rud.com (units & locations)

Do you wish for more technical consultation and assistance?

Then simply ask us. Directly contact our engineers and send us your challenges related to the conveyor system.
> conveyor@rud.com
> Technical questionnaires from page 60

Can you imagine what it would be like to work together with a company that is competent to solve all your challenges related to the conveyor system and moreover guarantees a high level of service and commercial support?

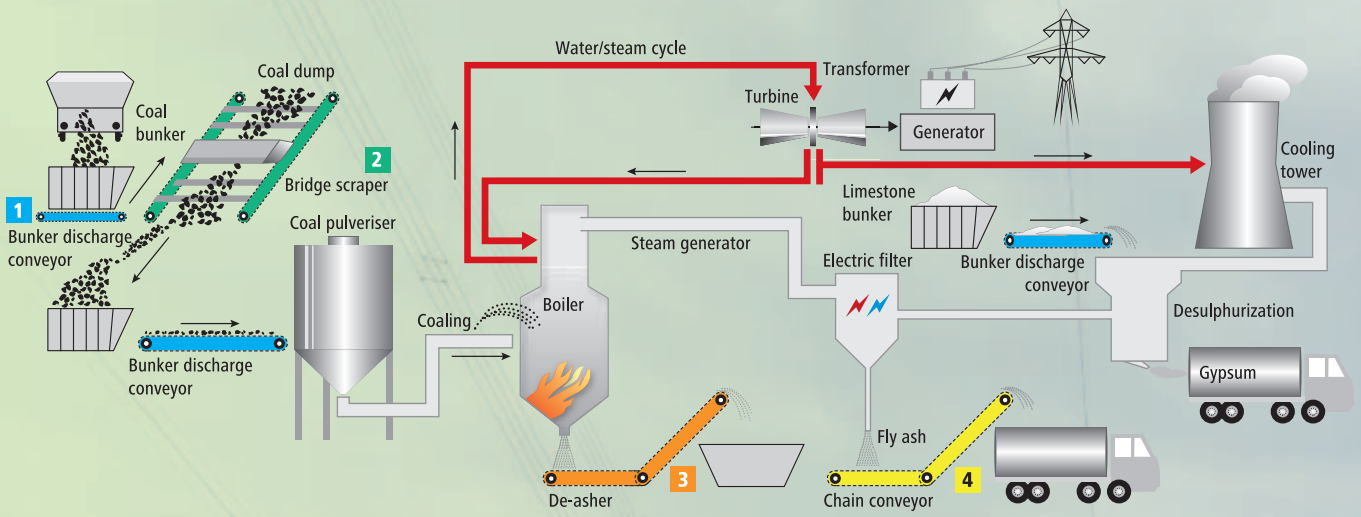
Then contact us at the german headquarters
> conveyor@rud.com
Tel. 0049 / 7361 50 41 457
Fax 0049 / 7361 50 41 523

Our Product range

Our service range
in the power station

CRATOS
UNLIMETED POWER

RUD



Fossil power stations will also become an important contribution towards global supply of energy.

For decades, RUD has been ensuring a high availability of coaling and ash remover plants with the help of its conveyor chains and hence ensures power generation in power stations.

Thanks to our extensive experience in ash removal of large power plant boilers, biomass combustion as well as waste incineration and recycling, all our system components are always perfectly coordinated and always work reliably.

of RUD conveyor technology in the power station

CRATOS
UNLIMETED POWER

RUD®

1875: RUD as the foundation of ERLAU AG

1951: First RUD global case-hardened round link steel chain

1957: First RUD chain for de-ashing

1965: First round link steel chain in RUD 40 cG material

1985: First round link steel chain with RUD Super 35 quality

1992: First RUD apron conveyor

2006: DUOMOUNT

2007: RUD forked link chain FORKY

2008: First dry ash remover with RUD chains

2010: **RUD CRATOS**

2012: First biogas-substrate feeder

2015: Conveyor chain R160

Milestones

for conveyor system for bulk materials

BULKOS
THE BULK SOLUTION

RUD®

1875 Foundation of RUD Ketten Rieger & Dietz GmbH u. Co. KG

1906 As the first company, RUD introduces electric welding of chain links

1945 Foundation of business area of conveyor systems by Werner Rieger

1961 Introduction of double-pitch case-hardened round link steel chains for high-capacity bucket elevators

1965 Introduction of round link steel chain in 40cG material / market introduction of two-link bucket attachment system 65

1985 Round link steel chain with RUD Super 35 quality

1992 RUD apron conveyor

1994 RUD central chain installed in high-capacity bucket elevators

2001 Market introduction of RUD SWA side-wall attachment

Milestone of H+E conveyor system technology

1932 Foundation of engineering office for conveyor systems

1933 Creation of 1st continuous flow conveyor for bulk materials

1940 Beginning of own production of 1st chain bucket elevator, 1st screw conveyor, 1st apron conveyor

1945 Foundation of machine factory Herfurth & Engelke

1960 1st belt bucket elevator

1969 1st chain bucket elevator for 300 t/h

1970 1st trough chain conveyor for 600 t/h

1972 Transport of 1000 t/h (band conveyor)

1973 1st screw conveyor for 300 t/h

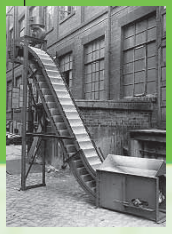
1981 1st vertical screw conveyor

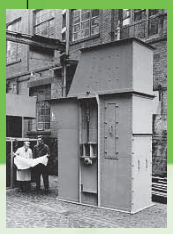
1985 Development of high-capacity bucket elevator, 1st usage of steel cord belt in bucket elevators

1988 Development of parallel weight tensioning station for bucket elevators, transport of 3000 t/h (band conveyor)

1998 1st central chain bucket elevator, 1st chain bucket elevator for 1100 t/h

2001 1st central chain bucket elevator for 600 t/h





Together for over 200 years of competence in bulk material conveyance

BULKOS
THE BULK SOLUTION

2004 Integration of H&E in RUD group

2006 Market introduction of RUD 2win two-link bucket attachment

2007 RUD forked link chain FORKY

2008 Central chain bucket elevator for 600 t/h

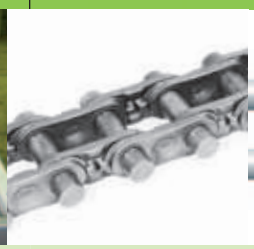
2009 First trough chain conveyor with RUD forked link chain FORKY

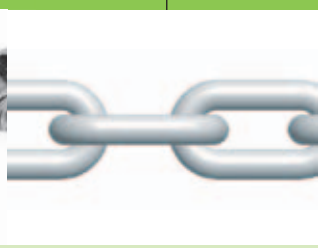
2011 1st tandem central chain bucket elevator for 1500 t/h

2011 1st TOOL MOVER

2011 Introduction of brand name BULKOS

2015 Conveyor chain R160





Whether it is a complete bucket conveyor, trough chain conveyor or spare parts for chain conveyors or maintenance and service, the RUD group is a reliable partner. Let it be transporting limestone from the mill to the bulk tank or conveying salts from the mine to the surface, our **conveyor systems** are robust and are optimally designed for these conditions.

Thanks to our extensive experience in bulk conveyance of fertilisers, potassium & salt, cement and other special bulk materials, all our system components always work reliably.

Chain production | **Milling** | **Heat treatment** | **Machine construction**

Our conveyor chain systems at a glance

HORIZONTAL CONVEYOR

RUD System	Sprocket wheel system						System pocket wheel		
Chain	Size 8 x 31 ... 38 x 144, material R80, R100, R140, R160								
Connectors	FL 22 x 86 ... 38 x 144		RSP 8 x 31 ... 19 x 7 5		VK 8 x 31 ...34 x 136		FL 22 x 86 ... 38 x 144		RSP 8 x 31 ... 19 x 75
Attachment type	Multiple link attachment			Single link attachment			Single link attachment		
Attachments	DUOMOUNT 26 x 100 ... 30 x 120	SSRF 14 x 50... 38 x 144	SSR 10 x 38 ... 30 x 120	F 18 x 64... 22 x 86	MEZZ 10 x 38 ... 38 x 144	FM 8 x 31 ... 30 x 120	MEET(K) 10 x 38 ... 38 x 144	F 18 x 64 ... 22 x 86	MEZT 10 x 38 ... 30 x 120
Drive wheels	Drive wheels (internal) interlocked, mostly multi-part at the drive after 14 x 50, rarely single, Locks always run vertically across the gears						Drive wheels (external) interlocked, mostly multi-part at the drive, rarely single, locks always run vertically as well as horizontally across the gears; preferred installation type vertical. Reversing wheels - very often also pocket wheels, rarely pulley blocks of type B for attachment F and type C for MEET(K) or MEZT.		
Reversing wheels	Type A with rim often at the tensioning station and as SOI, type B without rim for all the remaining deflections, rarely single gearwheels				Type C for attachment MEZZ and FL, alternative is single gearwheels				
Applications									
Remark	The sprocket wheel system is advantageous for conveyors that have an angled line profile (several times) (reversing wheels help this type of conveyors in association with the attachment) and have a sharp increase (>20°). Scraper height depending on the chain width, material to be transported and the gradient of the conveyor as well as the conveyance capacity must be calculated. Usual conveyance speed of 0.02 m/s to approximately 0.15 m/s depending on the service life to be projected. Typical example: De-ashing systems in power stations						Universally applicable as cleaning scraper conveyor, bunker discharge conveyor (multi-belt conveyor) as well as apron conveyor. Usual speed of 0.05 m/s to 0.2 m/s depending on the material to be transported. Straight line profile preferred, slightly inclined (up to 20°) installations possible. Scraper height normally not greater than OH =1,5 x b_a.		

VERTICAL CONVEYOR

System 65	2win System	SWA System	Central chain System
Size 14 x 50 ... 34 x 126, material R80, R100, (R140)			Size RU80, RU150, RU200
VK 14 x 50 ... 34 x 136	RSP 14 x 50 ... 19 x 75	FL 22 x 86 ... 34 x 136	Coupling strand; rarely necessary, if the tensioning distance is long enough
Multiple link mounting			**Mounting angle**
System 65 14 x 50 ... 34 x 136	**2win** 14 x 50 ... 34 x 136	**SWA** 16 x 64 ... 30 x 120	Is a separate component of the chain
Driving wheel toothed with individual teeth	Driving wheel not toothed, hardened segments, toothed drive such as in system 65 even in difficult applications	Drive wheel toothed with individual teeth, rarely not toothed	Drive not toothed, hardened
Reversing section always used with smooth sprocket, unhardened segments and flanged wheel	Reversing section always used with grooved sprocket, unhardened segments, special cases and with flanged wheel	Reversing section always usedwith grooved sprocket, unhardened segments and constriction wheel with hardened segments	Reversing section toothed (from 800 bucket width) / without teeth (up to 710 bucket width), hardened

Central chain bucket elevators for large conveyance capacities, coarse dry bulk materials (clinker, gravel, circulating goods and cement granules) and high speed (up to 1.7 m/s); steel chain bucket elevators.
System 65, for sticky, coarse-grained bulk materials, when using high-capacity bucket conveyors and speed 1.35 ... 1.5 m/s.
2 win system for DIN bucket elevators (DIN bucket without gear teeth, HL and special bucket toothed), low granulation (up to 40 mm without gear teeth, toothed after that), speed of 1.0 ... 1.4 m/s;
SWA system for small conveyance capacities and low speed (... 0.8 m/s), highly abrasive materials to be transported that are difficult to empty (central discharge with technical consultation).

RUD chain technology

New special products – What has improved in our new chain grades?

1. 100 % consistently inductively heated rods

This results in:

- Accurate link geometry
- Highly calibrated links
- Better engagement

Customer benefit:

- Optimised running geometry with components and wheels
- Better interlink contact to extend chain life

Customary conductive heating

2. 100 % fully automatic welding controller with precise link

This results in:

- Optimal process control

Customer benefit:

- Longer life
- Increased breaking force
- Safer operation

RUD is benchmark company in providing quality products with advantages in wear resistance and performance ahead of all competing companies

4. A world first! RUD conveyor chain R160 made of specially smelted special steel

This results in:

- New options in heat treatment

Customer benefit:

- Improved wear characteristics in case of equal breaking force

3. 100 % fully automatic control and regulation of calibration

This results in:

- Highly calibrated chain strands
- More accurate chain properties for multi-strand applications

Customer benefit:

- Optimised run-in behaviour
- Lower wear
- Lower maintenance costs

Sprocket wheel single-part

Properties:

- highly wear-resistant for difficult operating conditions
- unhardened for easy operating conditions

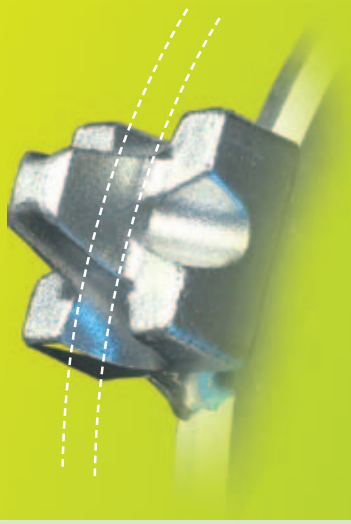
Ordering example:

Sprocket wheel: **single-part**
For chain: **19 x 75**
Numer of teeth: **8**
Hole-Ø: **...mm**
Dimension C: **...mm**
Dimension E: **...mm**
Number in piece **10**

- Other dimensions on request

Our tip

Toothed segments with increased pitch circle diameter



Tooth discs and individual teeth, optimally adapted to the proportional chain extension given at the time of replacement.

Available in dimensions 10 x 38 to 38 x 144 for all multi-part sprocket wheels.

Prices on request!

Ordering example:

System: _____

Chain: _____

Teeth no.: _____

Wheel no: _____

Part no. sprocket wheel: _____

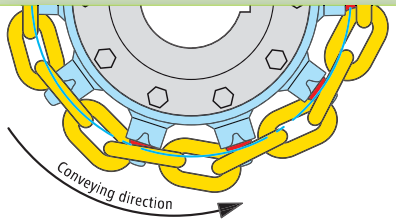
Drawing no. sprocket wheel: _____

Current chain length

in %: _____

Planned installation date:

_____



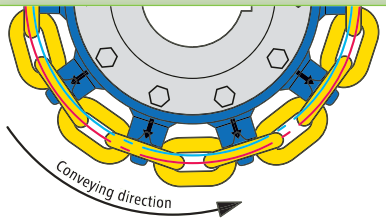
Previous chain runs aground!

Indications of too heavily work chain:

- uneven run,
- hook formation at rear tooth flank,
- flank clearance used up,
- strong vibration at the drive,
- chain falls only after several teeth on chain link support of the teeth

P.C.D. of standard sprocket wheel

The chain suited enlarged p.c.d. of the teeth



Later – the chain wear is compensated for by using a new tooth segment with larger tooth flank.

- The solution: sprocket wheels with increased pitch circle diameter.
- Replaceable tooth segments / individual teeth increase the life cycle of the complete sprocket wheel

Run-in behaviour of worn chain at the driving gear

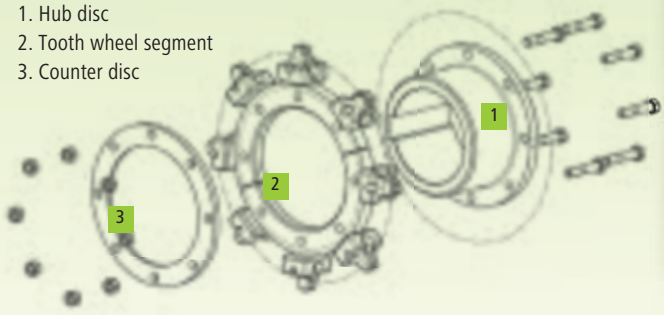
A. Distance of horizontal chain link – horizontal link support at the tooth (approx. 30 –35 mm)

B. Synchronisation of vertical link at the outermost tip of the tooth

In case of new chains, new tooth discs / individual chains should always be used.

Structure of sprocket wheel - multi-part

1. Hub disc
2. Tooth wheel segment
3. Counter disc



In case of new chain components, the horizontal link is on the horizontal link support of the tooth when running-in on the first tooth of the sprocket wheel. Chain elongation due to wear results in the chain mounting in the direction of the tooth tip. In this case, the vertical link is only taken from the tooth tip and there exists the danger of skipping the chain.

H = screw lenght I = clamp lenght
* with head screw

Properties:

- screwed and can be clamped / screwed in the tensioned chain strand
- for scraper height up to 1.8 times the outer chain link width
- variable scraper distance possible
- for rough operating conditions
- run over sprocket wheels and plain wheels

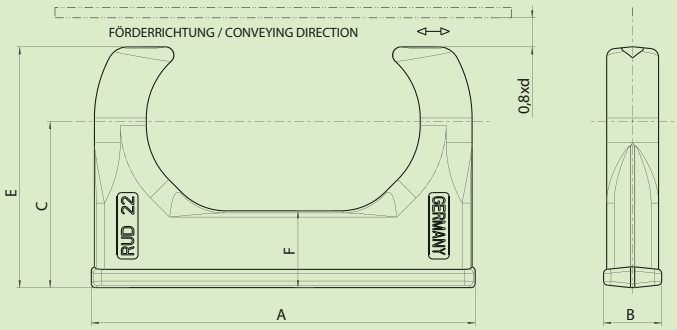
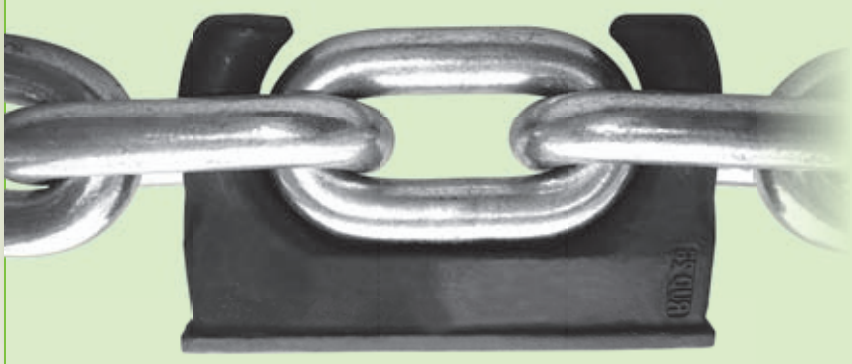
7903817	**38 x 144**	312	46	137	199	68	10

Properties:

- for very high conveyance capacities
- multiple link attachment
- for scraper height up to 2.5 times the outer chain link width
- weldable at scraper profiles of any shapes
- variable scraper distance possible
- highly wear-resistant
- run over sprocket wheels and grooved wheels





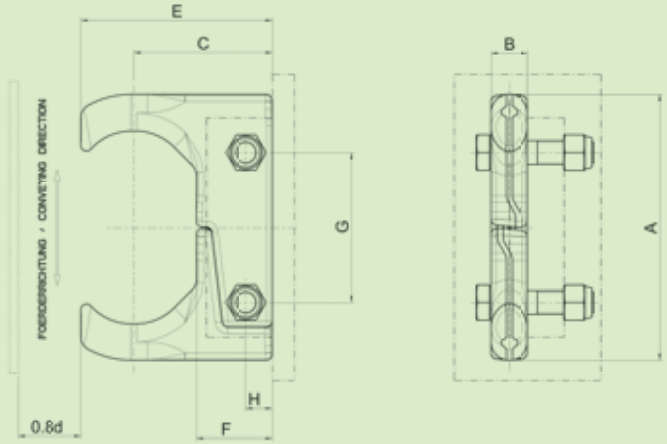
Attachment

System sprocket wheel

DUOMOUNT®

DUOMOUNT® Attachment										
RUD Part no.	Chain d x t in mm	A	B	C	E	F	G	H	I	kg / Pcs
7995852*	**26 x 100**	214	30	112	155	65	120	25	20.5	5.2
7996192*	**30 x 120**	252	35	129	179	75	142	27	24.5	8

* Distribution without screw



Properties:

- for very high conveyance capacities up to 50 t/h
- multiple link attachment
- for scraper height up to 2.5 times the outer chain link width
- can be tensioned in the tensioned chain belt
- scraper profiles of any shapes possible
- variable scraper distance possible
- highly wear-resistant
- runs over sprocket wheels and grooved wheels

Simplest assembly – in the tensioned chain strand!

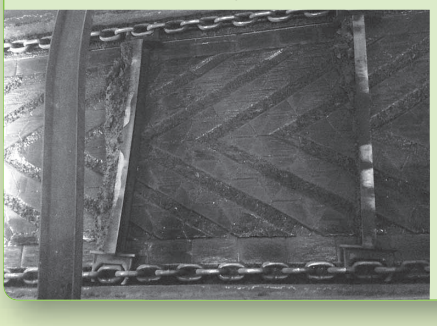
Scraper bars

Safer scraper operation with matched RUD strands

Our scraper bars and attachments form the perfect system in association with our paired chain strands:

- simplest assembly and disassembly
- optimal run across the pocket and sprocket wheels
- the suitable scraper design for every material to be transported
- lower wear
- no scraper tilting
- everything from a single source Chains, connectors, scraper bars and wheels

Unpaired scraper conveyor



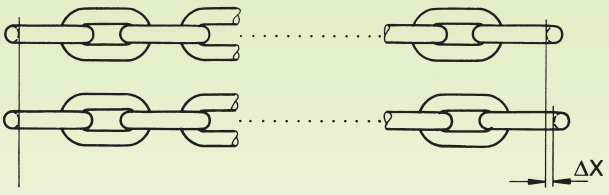
Paired RUD double-strand conveyor

RUD product advantage: Labelling of suitable pair using colours!

Strand lenghts, production tolerance:

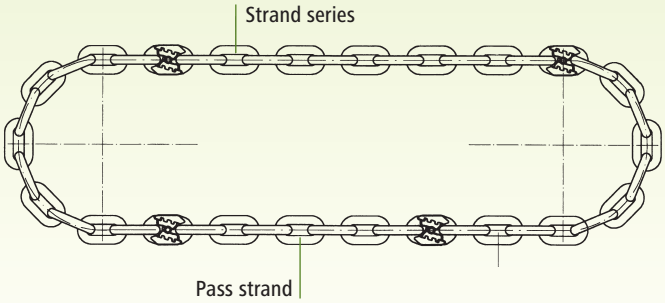
+ 0.4 %
– 0.15 % = 0,55 % max.

i.e. for 10 m lenght, max. difference 55 mm



Lenght tolerance ΔX of matched chain left (multiple-belt-conveyor)

ΔX = 0.05 % max., i.e. for e.g. 10 m long belts the max. difference is. 5.0 mm.
If the lenght of the belt is < 8 m, the largest pair tolerance = 4 mm.



- When ordering looped chain in millimetres, we require the precise scraper distance for distributing into individual belt lengths.

Scraper bars

The correct scraper bar for your requirements.

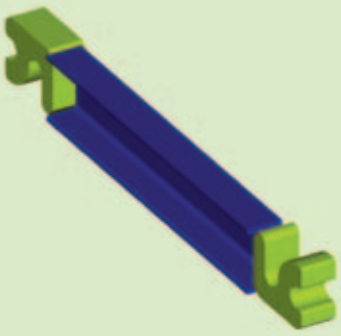
RUD scraper bars are always optimally adapted to the requirements and operating conditions specified to us by the customer. We produce scraper bars as per the specifications of the customers, provided that no consultation or support is necessary. Alternatively, we suggest an optimal scraper version based on an intensive consultation, which is developed in the dialogue

The following information is hence necessary and evaluated by us:

- clear trough width of the conveyor as well as its exact line profile
- trough bottom material and design
- chain centre distance
- maximum occurring / requested conveyance capacity
- conveyance speed
- properties of the material to be conveyed such as dampness, bulk density, angle of friction, particle size

Usage examples* – scraper bars and attachments

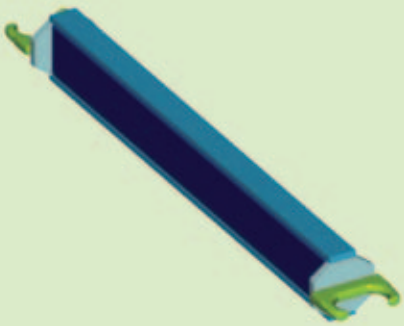
Standard U profile with MEE-T attachment



Typical usage options:

- cleaning scraper conveyor

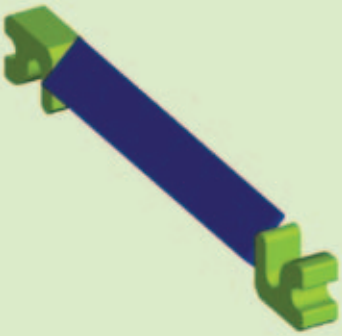
Standard scraper bar design for difficult conditions with SSRF or Duomount



Typical usage options:

- wet de-ashing systems

Standard angle profile with MEE-T attachment



Typical usage options:

- coaling systems / coal feeders
- Bunker discharge conveyor

*** Other scraper bar designs on request**

22 x 86	8 10	440 549	32.5 32.5	90 90

Other sizes on request.

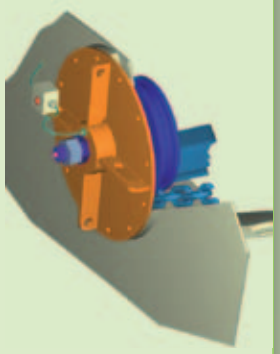
Properties:

- plain wheels with rim
- for both the use cases, however only possible when using flange attachments and very short scraper distances

* For dimension C and E, refer to page 64.

For ordering, please use the questionnaire on page 64.

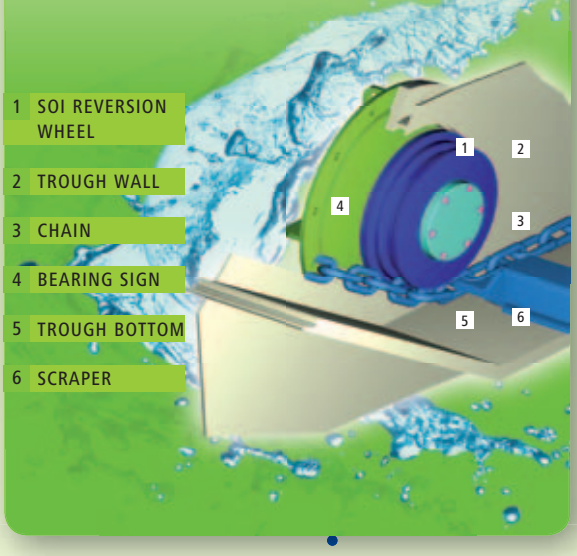
Submerged Overhung Idler (SOI)

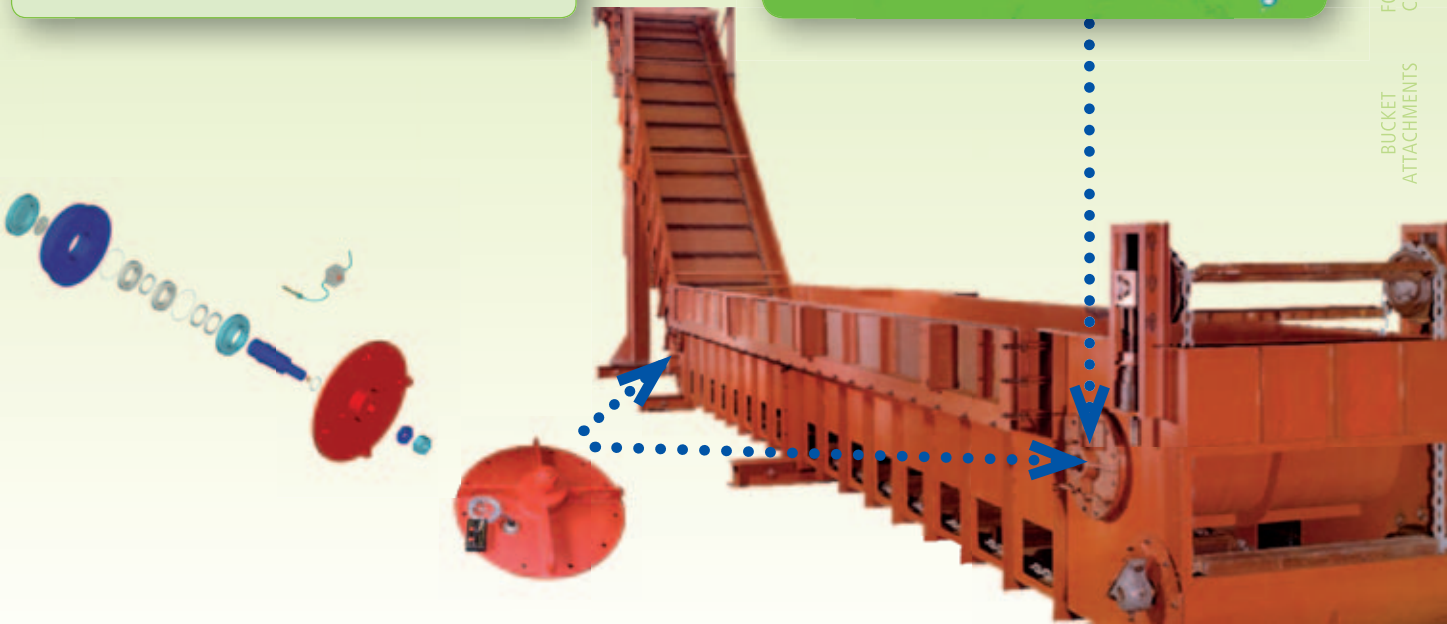


- Grooved wheels with rim for using in the hoistway
- Underwater sprockets vary from the normal reversion wheel only in the design of the "flying" shaft bearing, which are optimally designed by RUD for even these use cases. Numerous use cases all over the world prove their high availability.

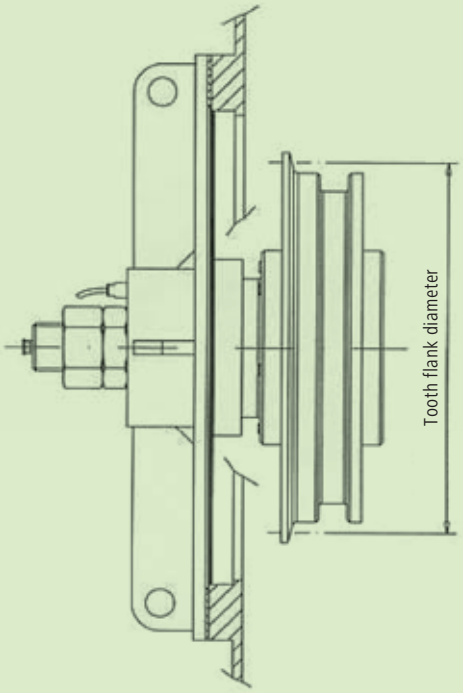
Underwater SOI

- Ideal for wet de-ashing systems
- Electronic circulation control optionally possible
- Assembly of outer wall at the trough
- Suitable for modifying old systems
- High-quality, robust and easy-running bearing technology
- Optimised bearing seal
- Easily accessible for maintenance works
- Deliverable in all reversing wheel dimensions
- Two design versions: with or without bearing shield in fixed casing hub





Submerged **O**verhung **I**dler **(SOI)**



Design SOI 1		
Chain d x t in mm	**PCD Ø**	**corresponding to the number of teeth**
19 x 75	290 384	6 8
22 x 86	331 440 549	6 8 10
26 x 100	386 512 639	6 8 10
30 x 120	426 614 766	6 8 10

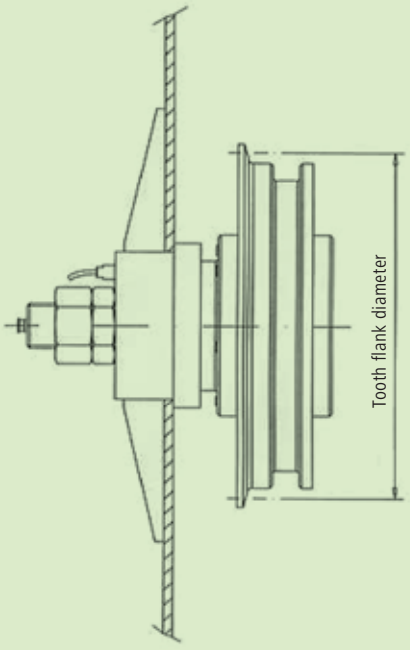
Ordering example:

SOI 1 22x86-400/790-10

Reversion wheel with bearing shield for chain 22x86-R100 with 400 mm sprocket Ø and 790 mm Bearing shield Ø with electric circulation control (1), without automatic lubricator (0).

Surface condition: Primed

For connecting dimensions refer to dimension sheet on page 62.



Design SOI 2		
Chain d x t in mm	**PCD Ø**	**corresponding to the number of teeth**
19 x 75	290 384 479	6 8 10
22 x 86	331 440 549	6 8 10

Ordering example:

SOI 2 22x86-400/790-10

Reversion wheel with bearing shield for chain 22x86-R100 with 400 mm sprocket Ø and 790 mm Bearing shield Ø with electric circulation control (1), without automatic lubricator (0).

Surface condition: Primed

For connecting dimensions refer to dimension sheet on page 62.

For ordering, please use the questionnaire on page 62.

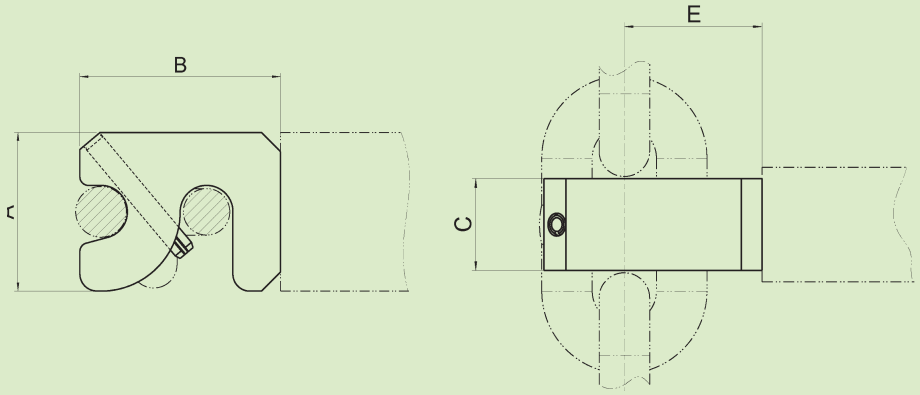
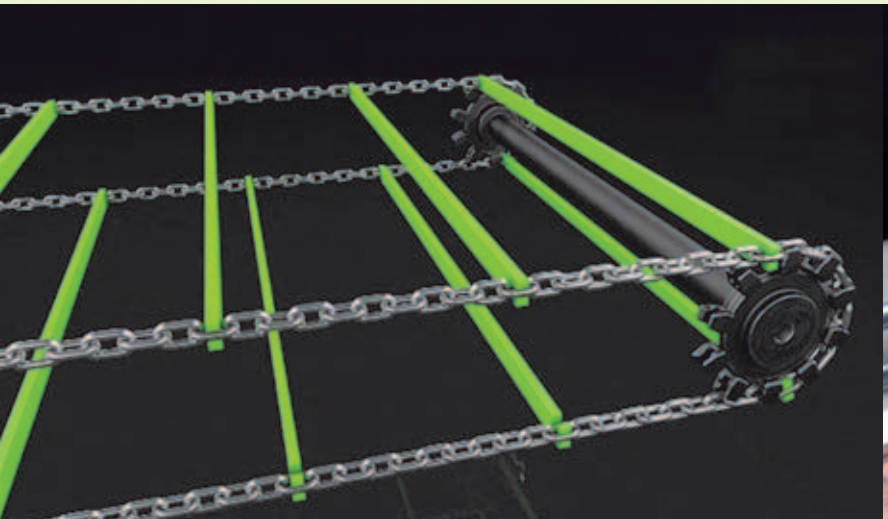
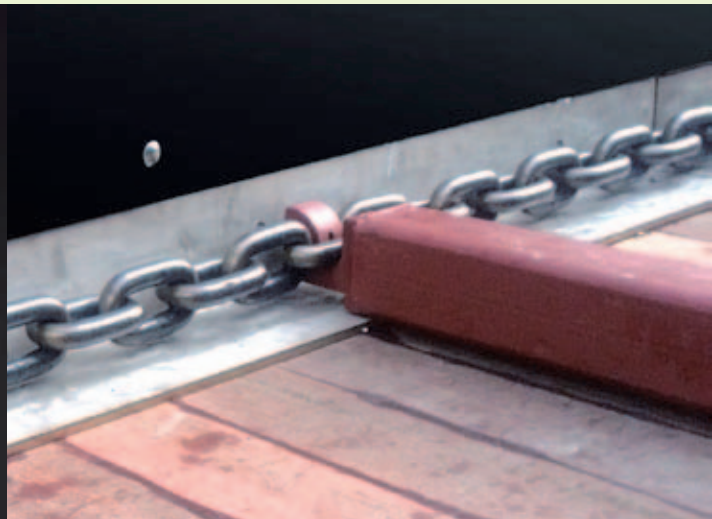
7992593	–	**38 x 144**	128	160	65	101	7.3



Properties:

- for difficult operating conditions
- scraper height up to 1.5 times the chain link width
- double-strand conveyor and multiple-strand conveyor systems
- can be welded to anything
- securing with locking pin if necessary
- run across pocket wheels and plain wheels
- Deliverable with and without pin locking





MEZ-T attachment

System pocket wheel

MEZ-T Attachment

	315 - 1600	1200	120	1.7	80	120	

Problems of the des DIN system

- Chain bracket has a double function
  - transmission of tension of the chain loop
  - fixing the bucket to the chain loop and absorbing bucket strain
- Weak point double-function may lead to fatigue fractures
- Additional consequences may be loose screw fittings
- Even over-dimensioning in heavy conveyor operations does not solve these problems

Solution RUD multi-link-fastenings 2win and system 65 (see page 39/40)

- Assembly over several chain links
- No transmission of tension from the chain to the attachment
- Gentle introduction of the scooping force into the chain strand
- Minimizing wear in the chain joints

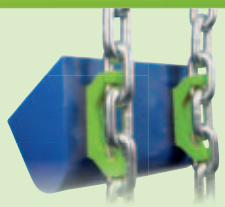
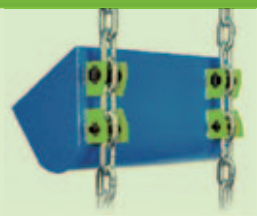
BULKOS bucket elevators



These are specially designed for the dust-free, vertical conveyance of powdery, granular, lumpy and high temperature bulk materials.



Highly wear-resistant chains, traction wheels or sprockets ensure that even abrasive materials are transported reliably. Specially designed chaintype

bucket elevators are available in either centrifugal/gravity, positive or central discharge designs dependent on the application.

Conveying capacities, reference values for approx. 75 % filling

*) Not included centre discharge bucket elevators with bucket attachment SWA.

Chain elevators

Description

The **bucket elevator casings** are selfsupporting, but they require horizontal guides at least every 15 meters and below the elevator head. **The bucket elevator head** comprises a lower section with doors to access the adjustable discharge plate, and braced bearing mountings, for the pedestal bearings which support the drive shaft, the shaft exit points use grease filled radial shaft seals. The upper sections comprise a multipart removable hood with an inspection door. A drive platform is mounted on the side of the lower part of the head for supporting a wide variety of commercially available drives. If required a maintenance platform and or an overhead support/ service beam can be fitted if required. An elevator drive normally consists of a geared motor unit, which is normally connected to a frequency controller for maintenance purposes. For higher power requirements, we recommend a drive unit with a bevel spur gearbox, and standard motor optionally with ancillary drive. Starting characteristics can be optimized by a hydraulic clutch or an electric soft start.

The **double or single leg casing** is torsionally rigid sheet metal housing, constructed of standard section lengths with flange connectors. The maintenance and assembly door position should preferably be located in the elevators raising casing leg, approximately 0.8 m above a platform.

The **elevator boot** is optionally designed with either internal, oil-filled bearings or external pedestal bearings. With external bearings, the shaft exit points are sealed by gray cast-iron stuffing boxes. There are large assembly doors and cleaning doors on both sides. The chain takeup tension is generated by a weight or spring-loaded spindle take-up device.

Depending on the type of chain used, RUD driving wheels are either non-toothed chain pulleys with replaceable, highly wear-resistant segments, or toothed sprocket wheels with replaceable, highly wear-resistant teeth. The **RUD return wheels** have replaceable, highly wear-resistant segments which in certain designs incorporate guide discs.

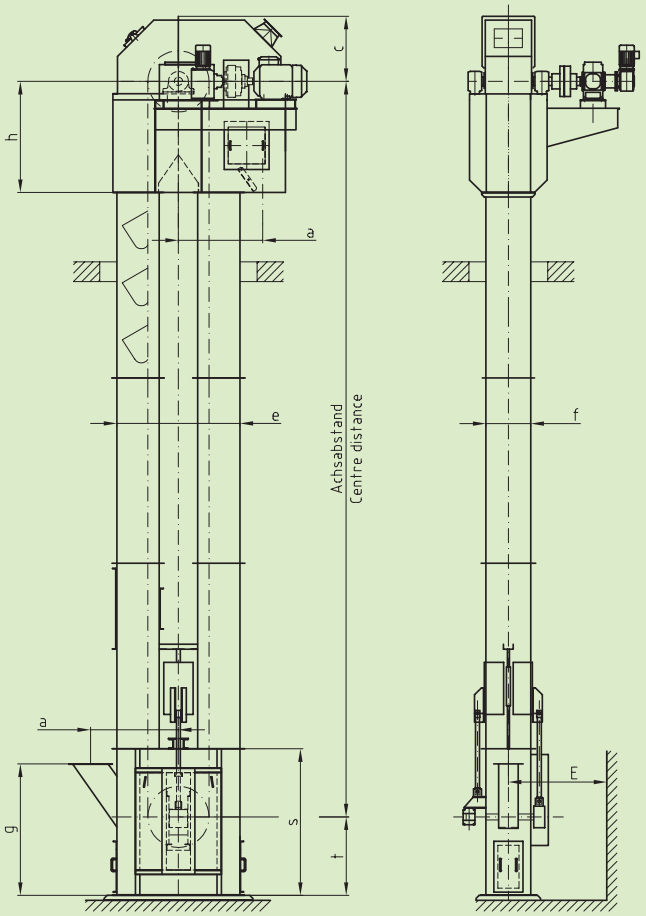
Buckets are manufactured according to DIN or our works standard. The materials used are steel, stainless steel, or rubber.

Buckets are attached by chain shakkles, bolted clamping clips, plug-in attachments or angle brackets.

The **chains** are either hardened, round link chains to DIN Standard or works standard chain designs made of special, highly wear-resistant alloy steel. Engineering style chains are also used, as either double or single central chains.

Standard **safety devices** such as speed governors and level indicators, to monitor the operating status of the bucket elevator are incorporated.

Additional **accessories** are available.



Back-wall bucket attachment 2win

Back-wall bucket attachment 2win								
RUD Part no.	Chain d x t in mm	A	B	G	H	I	K	Weight [kg]
7998699	**14 x 50**	124	40	M14	30	56	39	0.9

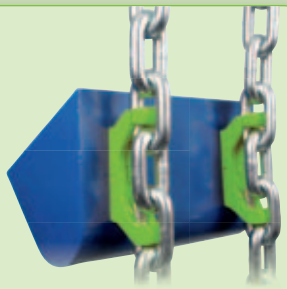
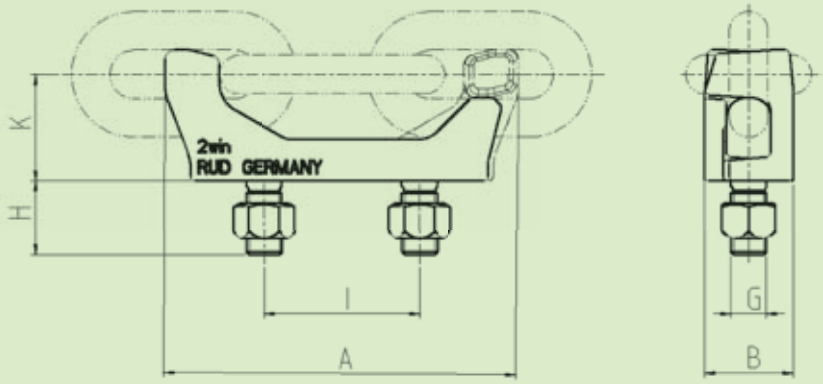
7993608	**34 x 136**	327	92	M36	70	147	96	9.3

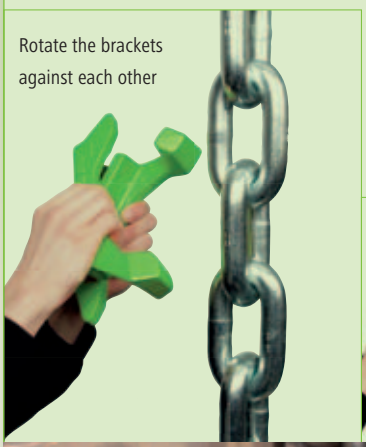


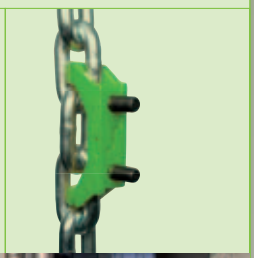


Properties:

- for using bucket conveyors with up to 60 m height
- endless chain strands can be used
- short assembly and disassembly times, without special tools
- bucket attachments runs over sprocket wheels and plain wheels
- suitable for replacing all the DIN bucket attachments in round steel link chain bucket elevators exept side-wall attachments

Assembly sequence:





Side-wall attachments

SWA

Side-wall attachments SWA								
RUD Part no.	**Chain d x t in mm**	**A**	**B**	**G**	**H**	**I**	**K**	**Weight [kg]**
7992042	**16 x 64**	140	81	M16	35	105	37	0.6

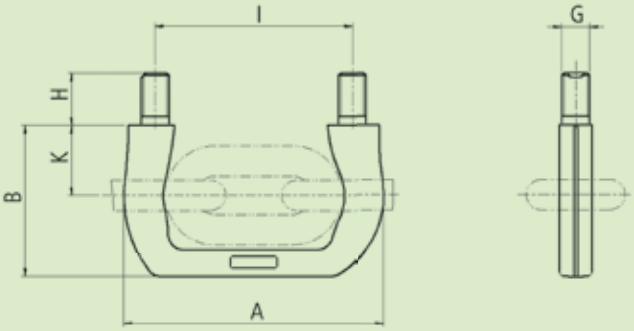
7990872	**30 x 120**	258.5	153.5	M30	55	198.5	71	3.5

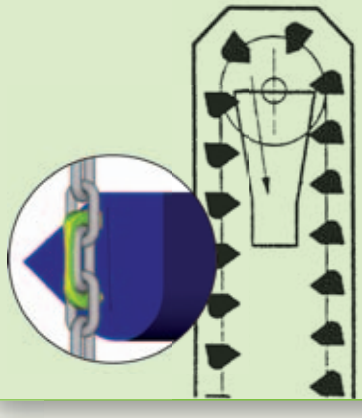
Properties:

- For using in slow-running bucket elevators with gravity drain, central discharge bucket conveyors and return-feed bucket conveyors
- endless chain strands can be used
- easy assembly in case of variable bucket distance
- two-link bucket attachment for a smooth run across the gears

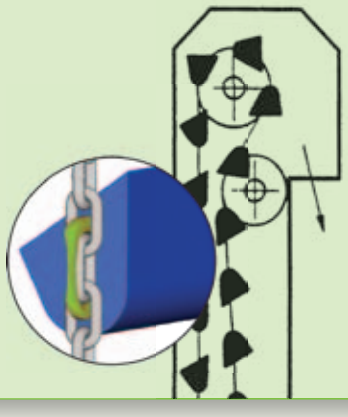
Assembly sequence



for central discharge bucket conveyors



Centre discharge bucket elevators



Chain wheel
for bucket elevators

Chain wheel for bucket elevator						
Chain d x t in mm	**PCD Ø**	**B**	**C**	**D**	**Number of segment pairs**	**Weight of the complete sprocket approx. kg/piece**
14 x 50	500	19	55	120	4	70

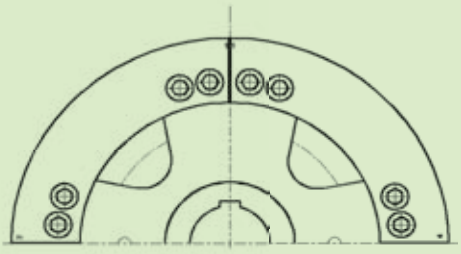
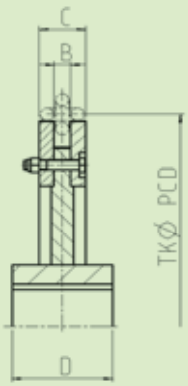
34 x 136	1250	44	114	220	4	500

Properties:

- Especially suitable for RUD systems **2win** and SWA
- finish-drilled and grooved as per customer requirement
- robust welded construction with replaceable bearing ring segments
- hardened bearing ring segments for the drive
- unhardened bearing ring segments for deflection





Ordering example:
Chain sprockets for system: **2win**
Design: **Complete**
PCD Ø in mm: **710**
For chain: **19 x 75**
Number in pieces: **4**
Hub bore hole: **120^{H7}**
Segments: **hardened**

Special grooved wheels and guide wheels on request.

Assembly of chains across the smooth drive chain wheels in the bucket elevator.

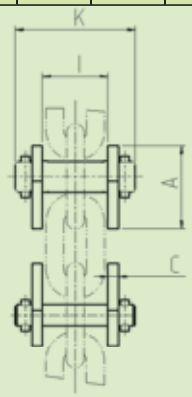
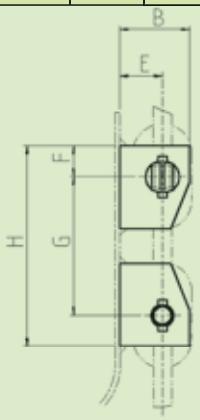
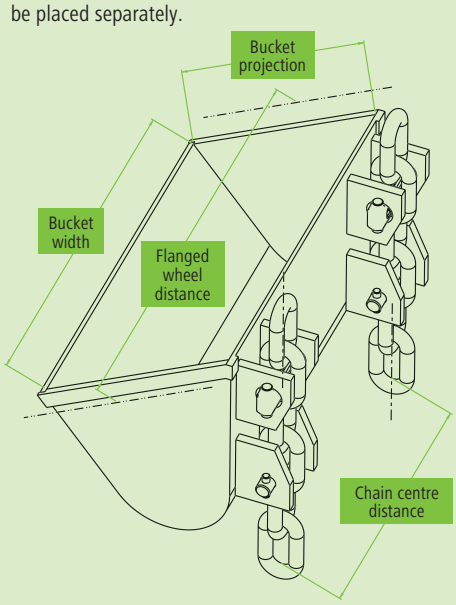
Properties:

- for heavy operating conditions in the bucket elevator area
- robust and highly wear-resistant
- easy assembly and disassembly of buckets on the chain





[1] The complete version includes the following components:
2 x flat steel part A, 2 x flat steel part B,
1 x plug-in attachment round,
1 x plug-in attachment flat.
A repeat order for individual parts such as flat steels and plug-in attachments can also be placed separately.



Reversing wheel

for system 65 bucket elevators

Reversing wheel for system 65 bucket elevators				
Support Ø G	**A**	**C**	**E**	**Weight kg/piece**
540	110	70	140	120
575	100	70	140	125

	16	1387	390	110	220	677

Teeth with increased link support also available. For this refer to page 20.

Properties:

- replaceable individual teeth are made of MnCr special steel
- the teeth are highly wear-resistant
- surface hardened
- hub and secondary sheaves are welded construction

Ordering example:

Sprocket wheel:

For chain: **22 x 86**

RUD central chain

RU80 · RU150 · RU200

Components of central chain

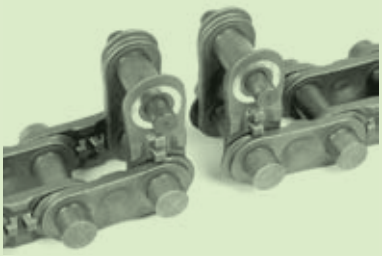
The central chain consists of four basic elements, inner plates, bolts, outer plates and bucket attachments.

The chain can be easily opened, shortened or extended by simply bending the chain links at every position without the tool in an assembly- and disassembly-friendly way.

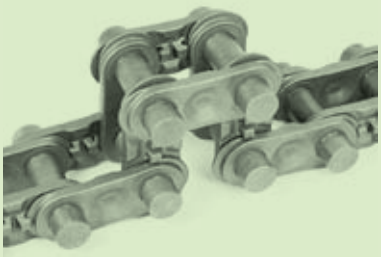
A favourable force distribution and tolerance compensation is achieved using the bolt bearing at the outer plate, which is also carried out in the bushings.

The buckets are mounted using bilaterally stable bucket attachments, which are pushed to the bushings of the outer plates. Increase in the useful life in case of wear of the chain can be achieved once again by turning over the chain.

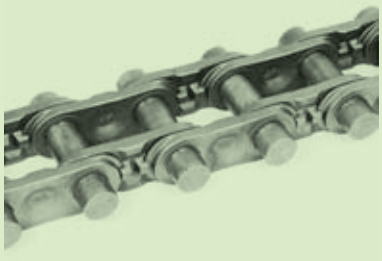
Assembly sequence:



1. Insert the bolts



2. Insert the outer plates



3. Stretch the chain – finished without tools

RUD central chain

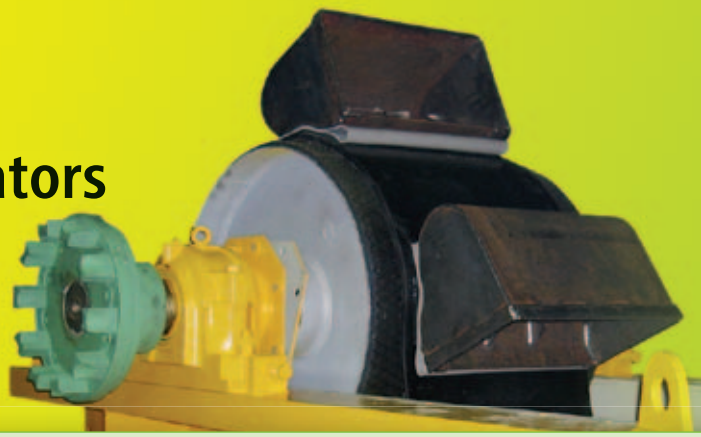
Belt type bucket elevators



Belt type bucket elevator designs using textile or steel reinforced belts transport materials dust-free without difficulty, even to great heights and are especially suitable for the continuous vertical conveyance of free flowing bulk materials. Suitable adaptations are made to handle coarse-grained or higher temperature materials.

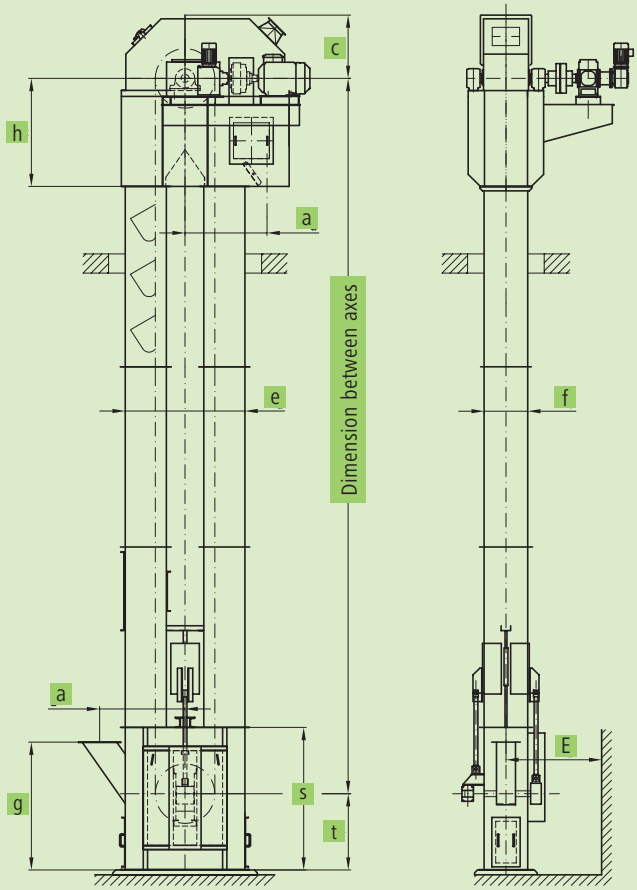
Belt type bucket elevators

Description



The **bucket elevator casings** are selfsupporting, but they require horizontal guides at least every 15 meters and below the elevator head. The **bucket elevator head** comprises a lower section with doors to access the adjustable discharge plate, and braced bearing mountings, for the pedestal bearings which support the drive shaft, the shaft exit points use grease filled radial shaft seals. The upper sections comprise a multipart removable hood with an inspection door. A drive platform is mounted on the side of the lower part of the head for supporting a wide variety of commercially available drives. If required a maintenance platform and or an overhead support/ service beam can be fitted if required.

An elevator drive normally consists of a geared motor unit, which is normally connected to a frequency controller for maintenance purposes.

For higher power requirements, we recommend a drive unit with a bevel spur gearbox, and standard motor optionally with ancillary drive. Starting characteristics can be optimized by a hydraulic clutch or an electric soft start.

The **double or single leg casing** is a torsionally rigid, sheet metal housing constructed of standard section lengths with flange connectors. The maintenance and assembly door position should preferably be located in the elevators raising casing leg, approximately 0.8 m above a platform.

The **elevator boot** is optionally designed with either internal, oil-filled bearings or external pedestal bearings. With external bearings, the shaft exit points are sealed by gray cast-iron stuffing boxes. There are large assembly doors and cleaning doors on both sides. The belt take-up tension is generated by a parallel weight or spindle take-up device.

Whereas the parallel weight take-up automatically compensates for belt stretch, the spindle take-up requires manual readjustment. The **driving pulley** has a structured rubber covering. Easy to replace, bolt-on, dished rubberized segments are available upon request.

The **take-up pulley** is designed as a cage drum. Internal cones guide any material that enters the drum out to the sides.

The **buckets** are manufactured according to DIN or our works standard. The materials used are steel, stainless steel, aluminum, plastic or rubber. The **bucket attachments** are selected according to the loads to be handled. Rubber strips are fitted between the belt and the backs of the bukkets. The buckets are attached by means of belting bolts, spherical or half-round segments with countersunk bolts. The belts are available with textile or wire-cable reinforcement. Hot-material rubber compounds are used for transporting high-temperature materials. The belt is jointed by mechanical connecting brackets or claw connectors. Belts with a low linear expansion can be continuously vulcanized.

Standard **safety devices,** comprising off-track governors, speed governors and level indicators, to monitor the operating status of the bucket elevator are incorporated.

Additional **accessories** are available.

Belt type bucket elevators

The RUD drive drum design, with a cylindrical central section and laterally decreasing diameter, ensures

- uniform load distribution across the width of the belt
- low wear on the friction lining
- stable running of the belt and so
- a longer service life for the bett

The RUD drive drum design with interchangeable friction lining:

- The friction lining is easily exchangeable when worn
- It can be exchanged without removing the drum or opening the belt
- This makes it easier to maintain and so
- Reduces down times
- The segments can be re-used after replacing the rubber

The RUD parallel tension unit ensures:

- automatic extension compensatiop of the belt
- a low pretension force and so low loading
- stable running of the belt
- a maintenance-free design

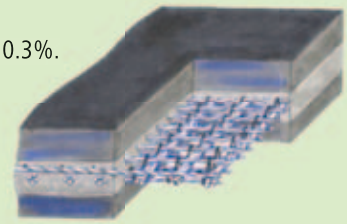
Belt type bucket elevators

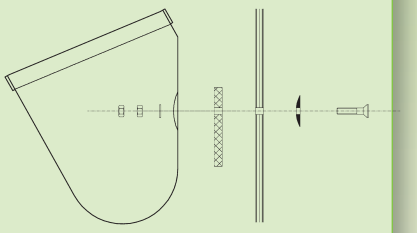
RUD bucket attachments

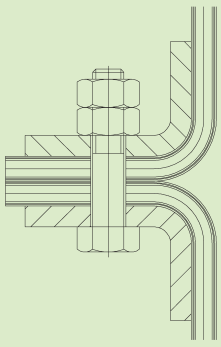
- have soft rubber inserts between the backwalls of the buckets and the belt, wh ich prevent the material jamming and reduce the effects of heat on the belt
- can optimal adapt to the convexity of the drums
- have always the optimal fastening element for the particular load
- have extremely high tear-off strength when used with steelrope belts, even in the coarse grain range

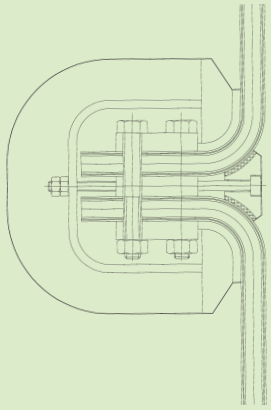
RUD steel-cable belts have

- a tensile strength of 800-3150 N/mm belt width and a low linear eleongation of maximally 0.3%. This means that the belt never needs shorteningduring its entire service life.
- steel cross-bracing on both sides to give high transverse rigidity, and so optimal straight running and high tear out strength of the buckets.
- hot material rubber compositions for conveying material at a continuous temperature of up to 130°C, and temperature-resistance up to a maximum 10°C peak load.
- 5 mm thick cover plates on both sides and solid rubber edge protection for a long service life, even when handling highly abrasive materials.
- bucket attachment holes cut by water jet to ensure the highest quality
- belt ends prepared in the works for endless connection with mechanical belt connectors. Endless closure can also be achived by hot vulcanization.









Trough chain conveyor

Trough chain conveyors are especially suitable for the dust-free, horizontal and moderately inclined transport and metering of bulk materials, including coarser type material. Trough chain conveyors combine high wear and heat resistance with the option of multiple inlets and outlets. We also supply a special version with cleaning scrapers.

	s	550	550	550	550	550	550	550	550	550	550

Trough chain conveyor

The **drive station** has flange or pedestal bearings for the drive shaft, depending on the size. Sealing is provided by grease filled, double radial shaft seals. The entire drive station together with the inspection door can be dismounted for easy maintenance. The drive consists of a standard geared motor unit mounted on the bracket attached to the side. Suitable safety clutches can be provided to prevent overloads.

The **trough** consists of individual, standard-length sections with connecting flanges. Hold-down rails are recommended for most of the materials to be conveyed. These prevent the material from building up and thus the chain climbing. For moderately abrasive materials, the side walls and base plate are protected by manganese alloy steel against wear. Fusion-cast basalt linings or liner plates with hard surface welding are recommended for use with highly abrasive materials. In special cases, the trough floor can be designed to act as a material pad.

The **take-up station** has flange bearings to hold the take-up shaft. The shaft exit points in the housing are equipped with grease filled, double radial shaft seals. The entire station together with the inspection door can be dismounted for easy maintenance. The chain take-up is generated and set by spring-loaded pressure screws.

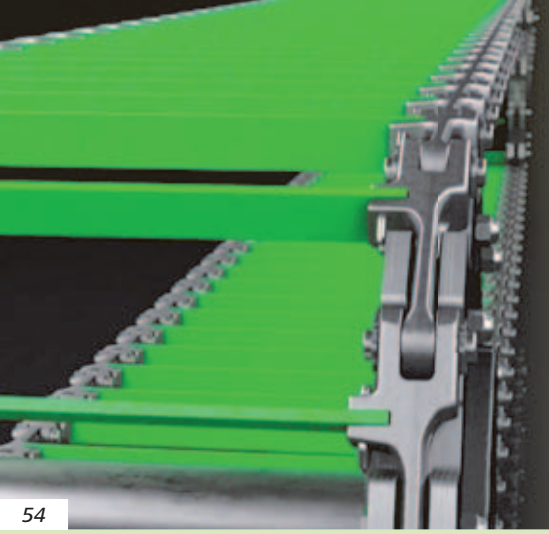
The **driving and return sprockets** are highly wear-resistant and have interchangeable, hardened toothed segments.

The standard **conveyor chains** used are forged, fork-sprocket chains that have been heat-treated or case-hardened.

The resistance to wear can be further increased by hard surface welding. Available options are: highly wearresistant RUD round steel chains, bushed transporting chains according to DIN 8165 and block chains.

Standard **safety devices**, comprising speed governors and take-up screw monitors, detect the operating status of the trough chain conveyor.

Additional **accessories** are available.

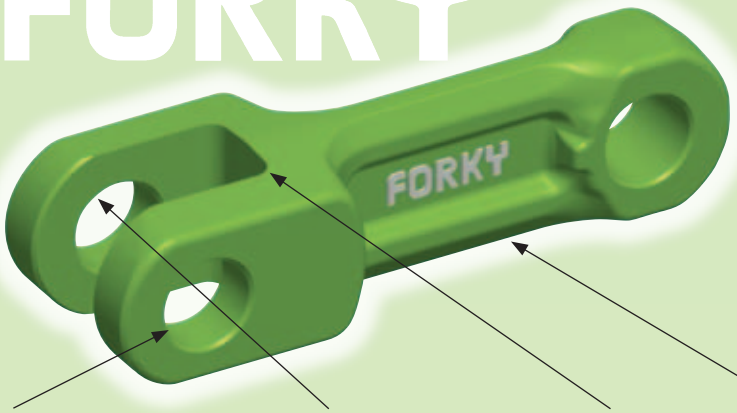


FORKY

Forked-link chains

Single · double strand

FORKY



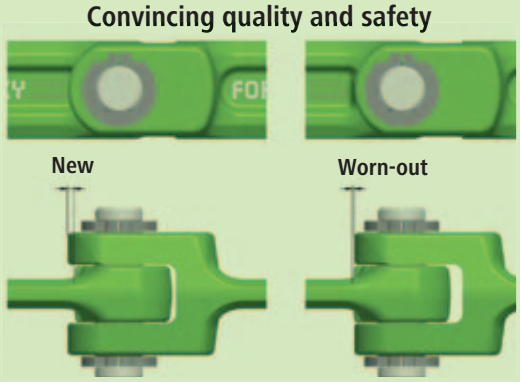
Deburred bores
- even inside the fork for highest endurance strength and reliability

Bores parallel to the axle with higher graduation accuracy
- for smoother running and hence
- for minimum wear

Extra large radii
- for more stability of the fork

Tensioning-optimised bar form
- for high lateral stiffness

Convincing quality and safety



Optical wear indicator
- the wear condition can be recorded at a glance at every individual chain link

Forked-link chains are suitable for transporting powdered, flaky, grainy and fragmentary bulk materials, but not for sticky or baking bulk materials.

Examples:
flour, cement, grains, sugar, chemicals, chipped wood, chips, foodstuff, animal feed etc.

Advantages
- simple and robust construction, high operational safety
- lower space requirement
- horizontal, inclined and vertical conveyor possible
- explosion safety through slow conveyance without recirculating the material

Disadvantages
- limitation of use regarding suitable conveyance materials
- no chunky, fibrous or sticky bulk materials

Drive wheels for forked-link chain FORKY

Properties:
- multi-part design
- tooth flanks inductively hardened
- the sprocket elements can be swapped at the hubs fitted

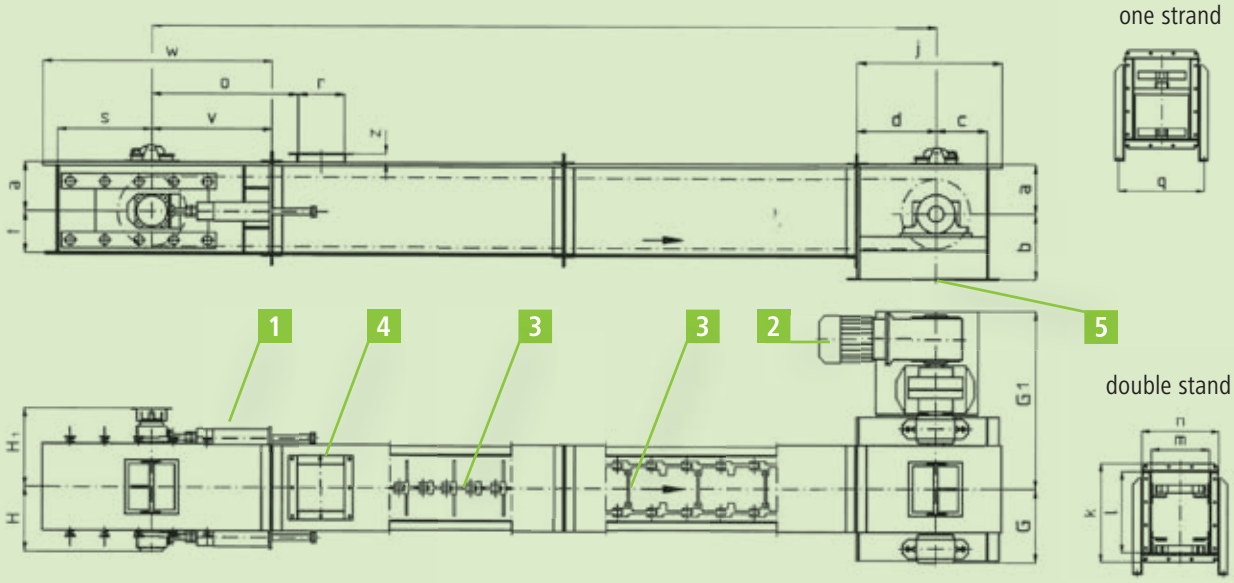
Reversion wheels for forked-link chain FORKY

Properties:
- single-part design
- contact surface inductively hardened

Please use technical questionnaire from page 69.

Trough chain conveyor

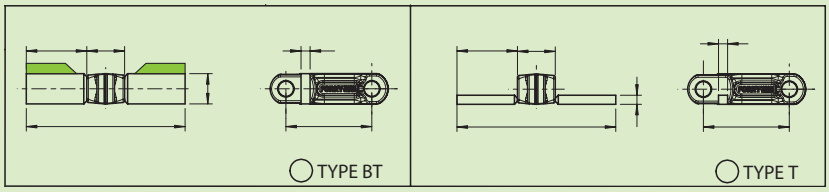
with RUD fork link chain



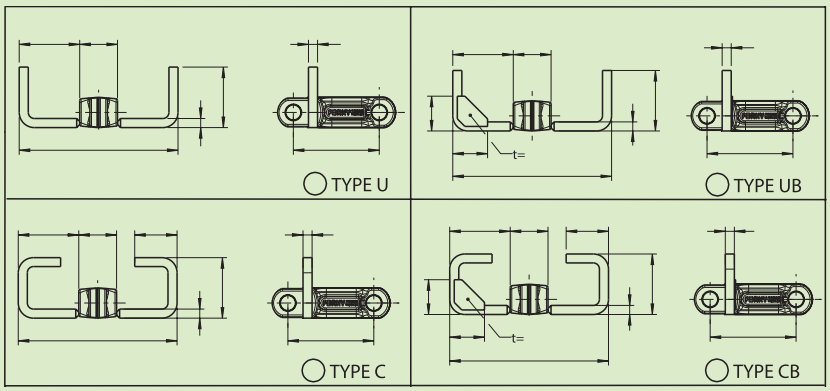
Trough chain conveyor

1. Tensioning station
2. Drive station
3. Conveyor chains
4. Feeding
5. Discharge

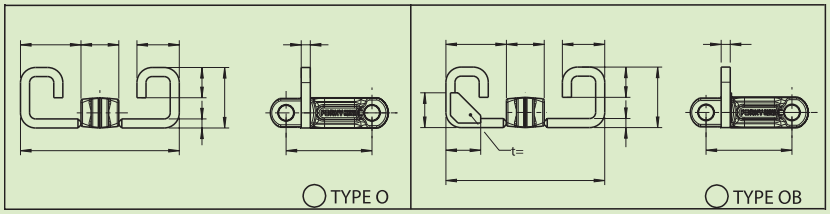
Available types:



Type T for horizontal and low ascending transport max. 10°
Type BT for horizontal and low ascending transport, dusty, free flowing material
Type BT special (height up to 1,75 x fork link height), also for high ascending transport max. 30°



Type U and UB (UB is custom-made) for high ascending transport, 10° up to 25°
Type C and CB (CM is custom-made) for high ascending transport and dusty material, 10° up to 25°



Type O and OB (OB is custom-made) for very high ascending transport, 25° up to 90°
Type C, CB, O and OB primarily for vertical transport

Trough chain conveyor

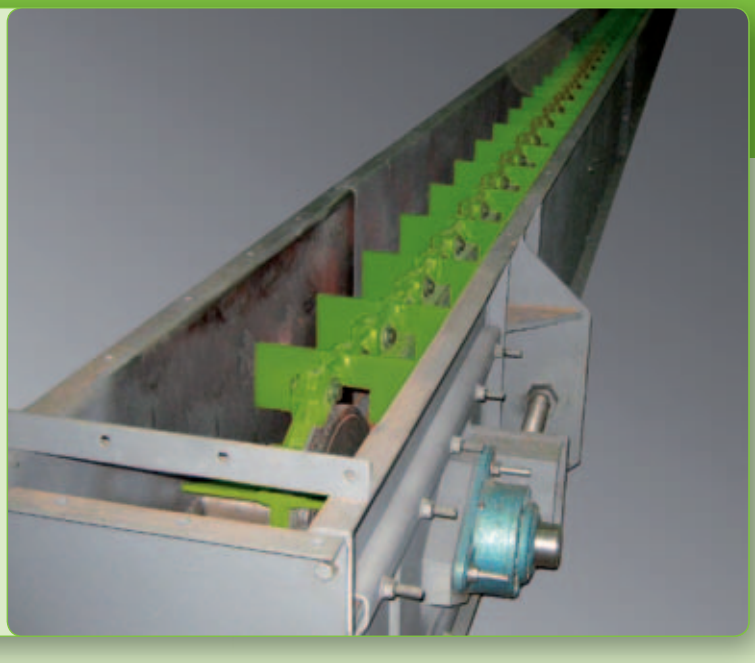
with RUD fork link chain

Applications for RUD fork link chains:

Condition of conveyed goods:
RUD fork link chains are ideally suited for transporting powdery, grainy, flaky, dusty or fragmentary material

Application:
construction-, wood-, paper-, plastic-, food and feed industry, chemical industry, mills, port cargo handling , agriculture and recycling industry

Examples of transported material:
cement, clinker, ash, wood chips, wood shavings, food and animal feed, recycled municipal waste fertilizer, gypsum, coke



Conveying speeds (m/s) (max. values)	
Material	**Speed**
grain	**1.10**
granulated material	**0.80**
coal, chips, soda	**0.50**
cement, phospate, gypsum	**0.25**
clinker, petrol coke, potash	**0.20**
filter dust, pyrite	**0.10**
ash, coke, sand, quartz	**0.05**

Screw conveyor

Long-lasting, easy to maintain screw conveyors are used for the dust-free, horizontal, inclined and vertical transport of fine-grained and floury materials. Suitable adaptations are made to handle coarse-grained, higher temperature, abrasive or poorly flowing materials. Screw conveyors also offer the option of multiple inlets and outlets. Various versions handle not only the transport of bulk materials but also emptying, metering, loading, screening and mixing.

Screw conveyor

The **conveyor trough** in trough **screw conveyors** is manufactured as a torsionally rigid sheet metal housing made of standard section lengths with connecting flanges, to which are bolted sturdy cover plates, there is also an inspection door above the outlet. Abrasive materials can be handled by using manganese alloy steel, hard surface welding, fusion-cast basalt linings or material padding. Split end walls are bolted to the ends of the trough. This makes it easy to dismount the screw shaft once the metal cover plates have been removed.

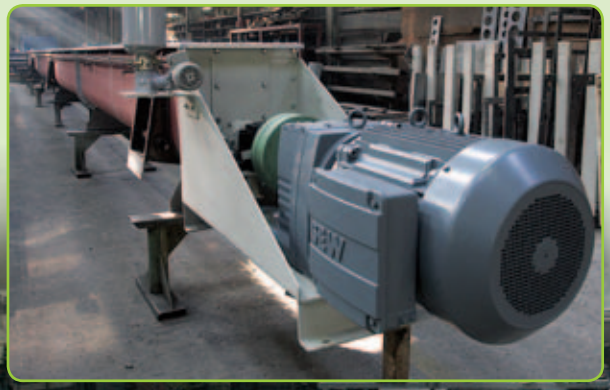
The **conveyor trough** in **tubular screw conveyors** consists of a stable tube with an inspection door above the outlet. One-piece end walls are bolted to the ends of the trough. These are suitable for supporting the conveyor. Intermediate supports are only required about every 6 meters. They are supplied loose for mounting during assembly. The shaft exit points are usually sealed by gray cast iron stuffing boxes.

The **screw shaft** is designed as a solid shaft or a rigid tubular shaft with integrated end journals and a welded-on screw thread. The end bearings are pedestal bearings with antifriction-bearing inserts. When a screw shaft requires intermediate bearings for longer conveying distances. These are designed as easily replaceable units, the torque is transmitted by bolted couplings.

We supply a plain bearing as standard with replaceable two-part, gray cast iron bearing shells. They can be set up for grease gun or central lubrication according to the operational conditions. On request, we also supply antifriction bearings with split roller bearings in a sealed, grease- filled suspended housing. The drive comprises a standard geared motor unit.

As a **safety device,** a speed governor detects the operational status of the screw conveyor.

Additional **accessories** are available.



General instructions

installation and operation

The adjustability of the deflection should at least be 3 link divisions (compensation of the setting process when running the chain or when chain abrasion takes place).

The usable tensioning distance should be determined after taking into account the length of the loop and the aggressive strain, which affects the chain.

Securing the round link steel chains against excess strain or getting blocked by coarse or foreign bodies by means of suitable safety coupling, shear pin or on the drive.

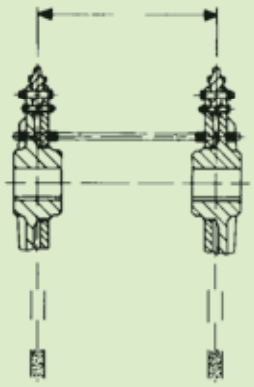
When assembling the sprocket wheels or pulley blocks as well as when manufacturing buckets / bucket attachment and when attaching insertion rails at the return station, accurate adherence to installation dimension and tolerances specified in the respective installation drawings is the prerequisite of proper functioning.

Adhere to the constant initial tension using springs or weights in adjustable tensioning devices, where the size of the chain pre-tensioning force must be coordinated as per the specifications of the respective conveyor. During their complete service life, the chains must be under the correct initial tension. Loose chains give rise to difficulties.

During all the system constructions, the corresponding accident prevention regulations must be considered.

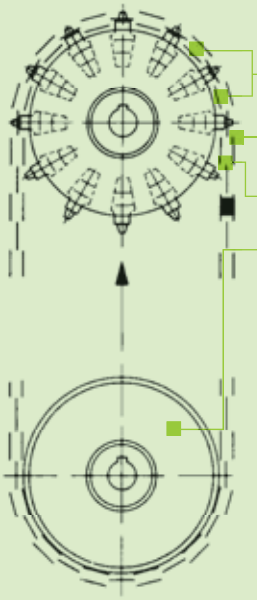
The bulk material to be transported must be supplied in such a way that equal distribution is ensured across the width of the buckets and all the chain loops are equally tensioned through the bulk material and the tractive force. In case of lateral feed, corresponding precautions must be taken.

Unequal loop stress leads to unequal increase in division due to the wear of individual chain loops; this results in the slanting of the buckets, which in turn results to faults at the return station.



Leave distance “a” by means of 2 limiting screws during assembly! (corresponding bores at the wheels available, no RUD delivery for limiting screws).

Wheels that are grooved pair-wise and marked using colours must be put on a shaft together.



The welded joints of the (vertical) chain links must point at the wheel centre.

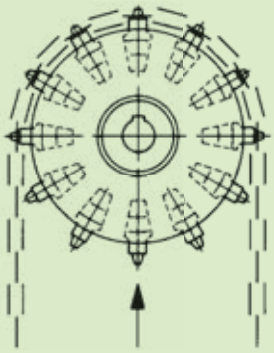
Vertical chain link

Welded joint

Deflection

In case of toothed drive:
chains should lightly touch the sprockets when circulating.

In case of un-toothed drive:
provide initial tension to the chain.



In case of replacements: here, replace individual teeth without taking off the chain.

When replacing the chains (setting up a replacement), the chain locks and the individual teeth must also be replaced.

The wear state of the chains is reached in case of permissible increase in division due to wear of about 3.5 %.

After an abrasion of 1.5 %...2.0 %, teeth should be used with increased link support.

Maintenance and monitoring Assembly instructions

of conveyor systems in RUD system

RUD conveyor chains – highly wear-resistant– are hard-wearing due to their simple structure assembly and hence require very less maintenance. The following points must be observed with regard to high operational safety:

Lubrication: RUD conveyor chains – highly wear-resistant – do not normally require lubrication. Such chains must however be lubricated with standard engine oil (not grease), which do not come in contact with the bulk material or aggressive dusts etc. and hence formation of lubrication gel paste in the joints cannot be safely ruled out. Dirty chains should be cleaned before re-lubrication.

Initial tension: the chain tensioning must be checked periodically, especially during the start-up phase of new chains and/or in case of large loop lengths. It must be tensioned only to the extent necessary for the proper functioning of the chain and carriers during normal operating conditions. In case of multi-belt conveyors, the initial tensioning force of all the chain loops must be equal. Unnecessary high initial tensioning force reduces the service life.

Monitoring: chains, locks, wheels, sprockets and flange parts must be checked at periodic intervals for damages, corrosion and unusual wearing parts, and the conveyor elements for deflection and the like. While doing so, attention must be paid to the state of the wearing and safety parts. Damages detected must be immediately rectified.

Wear: round link steel chains and wheel gearing wear out together up to the wear state under normal conditions. This is reached if the chain links at the driving gear run jerkily under stress due to the abrasion of the chain and simultaneous normal chain tensioning or come off suddenly, i.e. are coves off over the normal break-off point. If the distances between the axes is large, the bulk material is heavily worn out or corroded, in case of high speed, heat influence etc., the chain can run jerkily at the driving gear although the measured increased division due to abrasion is still less than approximately 1.5 %. In this case, the wheel gearing is worn out due to the especially high stress and only this must be replaced - but simultaneously at all the driving gears. In principle, the new round link steel chains must only be used along with the new wheel gearing. Round link steel chains, whose average link thickness at any location has reduced by more than 10 % of the nominal thickness, must be removed. (Average link thickness = mean of 2 dimensions taken perpendicular to each other at the maximum weakened cross-section).

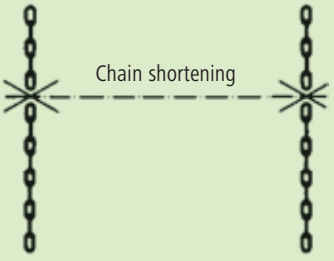
Thread dimension	Tightening torque	
	(Nm)	(Lbf ft)
M 6	10	7
M 8	25	18
M 10	49	35
M 12	85	62
M 14	135	98
M 16	210	152
M 18	300	217
M 20	425	307
M 22	580	420
M 24	730	528
M 27	1100	796
M 30	1450	1049
M 33	1900	1374
M 36	2450	1772

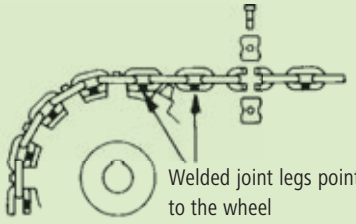
Permissible screw tightening torques for screw quality class 8.8 with total drive value $\mu_{ges.} = 0.14$.

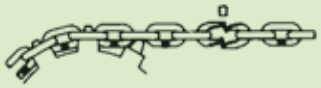
In case of necessary chain reductions, level links must be cut out at the belts to be shortened. Shorten chain belts to odd number of links only, in order to get level starting and final links. The chain links must **be carefully cut** using cutting discs and without damaging the neighbouring links. Avoid heat influences on links not affected by the cutting at all costs.

Welding works: in principle, welding processes should not be carried out at the round link steel chains, chain locks or deeply case-hardened components. It is not permissible to use the chain as earthing connection for electro-welding work at the steel construction.

In case of single and multi-belt conveyors: the welded joints of the chain links at the level of the gear must point at the driving gear; the position of the other links is arbitrary. Make sure that the installation position of the chain locks for the sprocket wheels is correct - coach bolt parallel to the sprocket wheel axis (also applicable for pocket wheels and striation sprockets). Install carefully and tighten the screws (strength class 8.8) using torque spanners. After a specific period, re-tighten the screws once again. Assembly for FA flat lock: link U brackets, hammer in locking bolts and secure with a locking pin.







Make sure the installation position of the chain locks is correct

RUD scraper bars are always optimally adapted to the requirements and operating conditions specified to us by the customer. We produce scraper bars as per the specifications of the customers, provided that no consultation or support is necessary. Alternatively, we suggest an optimal scraper version based on an intensive consultation, which is developed in the dialogue.

The following information is hence necessary and evaluated by us:

Clear trough width of the conveyor:

Exact line profile of the conveyor:

Trough bottom material:

Trough bottom design:

Chain centre distance

Maximum occurring / requested conveyance capacity:

Conveyance speed [m/s]:

Bulk material properties:	Dampness:	Grain size:
	Bulk density:	Angle of friction:

In case of special requirements, please enclose a specification or a sketch.

Conveyor & Drives

Sling and lashing system | Conveyor systems | Hoisting and drive technology | Tyre protection chains | Slide protection chains | Military technology | Furnishings

- RUD conveyor and drive systems offer you a variety of system solutions for your case of application. Whether it is conveying, driving or lifting, we shall offer you the suitable system.
- We construct and manufacture bucket conveyors, scraper conveyors and special drive solutions for lifting, conveying or moving preferably by means of round link steel chain as the traction mechanism.
- If required, we also use sprocket chains and belts.

- Our engineers provide an extensive background knowledge and support you as a competent partner for solving your conveyance task.
- If requested, the RUD service can visit you on-site and support you during the installation, reconstruction or maintenance of your system.

- We provide a high competency in conveyor systems of heavy bulk materials in the system construction.
- We solve special problems with our drive and handling technology in the industrial and maritime environment.

Communication medium for other RUD products:

- Sling and lashing system
- Drive technology
- Military technology
- Tyre protection chains
- Lifting chains
- Non-skid chains

CONVEYANCE AND DRIVE TECHNOLOGY

BULKOS

Whether it is complete bucket conveyor, chain conveyors or chain drive, RUD BULKOS rises to every conveyor challenge thanks to our extensive experience with the most varied bulk materials such as cement, fertilisers, stones and soils and many others.

MINING

RUD chain locks "Powerblock" and "Dominator" are considered as benchmarks of the industrial sector throughout the world and are used in high-performance mining companies due to their high level of reliability.

CRATOS

As the technology leader, RUD provides components and total solutions on the basis of round link steel chains and FORKY for energy generation with coal and biomass as well as in the area of recycling. Be it material supply, ash removal or cleaning scraper, RUD CRATOS® offers the suitable solution

INDUSTRIAL CHAINS

RUD is the global original equipment manufacturer among the leading lifting equipment manufacturers. We also offer a variety of round link steel chains for different industries.

TECDOS®

The RUD TECDOS® team is developing and manufacturing drive solutions for turning, lifting, moving, telescoping or shifting. In addition to the component program, complete solutions are also available as the TECDOS® Omega and Pi drives.
